## 1.1 Questions

1. A cylindrical fuel rod of diameter 2 cm generates heat at the rate of  $100 \text{ MW/m}^3$ . If water at a temperature of  $250 \text{ }^\circ\text{C}$  extracts the heat from the fuel rod, determine the maximum temperature of the fuel rod and the surface temperature of the fuel rod. The heat transfer coefficient may be taken as  $1200 \text{ W/m}^2\text{K}$ . The thermal conductivity of fuel is  $3 \text{ W/mK}$ .

2. A cylindrical fuel rod of diameter 2 cm generates heat at the rate of  $60(r/R) \text{ MW/m}^3$ . If water at a temperature of  $200 \text{ }^\circ\text{C}$  extracts the heat from the fuel rod, determine the maximum temperature of the fuel rod and the surface temperature of the fuel rod. The heat transfer coefficient may be taken as  $1100 \text{ W/m}^2\text{K}$ . The thermal conductivity of fuel is  $3 \text{ W/mK}$ . The average power per unit volume is  $40 \text{ MW/m}^3$ .

3. A rod of 2 cm diameter generates heat at the rate of  $10 \text{ MW/m}^3$ . The outer surface of the rod is at  $400 \text{ }^\circ\text{C}$ . If the thermal conductivity of rod varies with temperature as  $k=0.25+0.005*T$  where 'k' and 'T' are in  $\text{W/mK}$  and  $^\circ\text{C}$  respectively, determine the maximum temperature in the rod.

## 1.2 Answers

1. Data:  $T_c = 250^\circ\text{C}$ ;  $P_{\text{avg}} = 10^8 \text{ W/m}^3$ ;  $D = 0.02 \text{ m}$ ;  $h = 1200 \text{ W/m}^2\text{K}$ ;  $k = 3 \text{ W/mK}$

Before estimating the maximum temperature, the temperature on the outer surface of the rod ( $T_s$ ) can be calculated using Eq. (17)

$$T_s = T_c + P_{\text{avg}} \frac{D}{4h}$$

Therefore,  $T_s = 250 + 10^8 * 0.02 / (4 * 1200) = 667 \text{ }^\circ\text{C}$

Using Eq. (18) with  $T_s = 667$  to determine the maximum temperature as

$$T = T_c + P_{\text{avg}} \frac{D}{4h} + \frac{R^2 P_{\text{avg}}}{4k}$$

$T_{\text{max}} = 250 + 10^8 * 0.02 / (4 * 1200) + 0.01^2 * 10^8 / (4 * 3) = 1500 \text{ }^\circ\text{C}$

2. In this case, power per unit volume varies with radial distance as per the following equation:

$$P'' = P_{\max}''(r/R) \text{ and } P_{\text{avg}}'' = 40 \text{ MW/m}^3 = 4e7 \text{ W/m}^3$$

Equation (17) can be used to determine the temperature on the surface of fuel rod.

$$T_s = T_c + P_{\text{avg}}'' \frac{D}{4h}$$

$$T_s = 200 + 4e7 * 0.02 / (4 * 1100) = 381.8 \text{ }^\circ\text{C}$$

Maximum temperature of the fuel rod is determined by substituting  $r=0$  in Eq. (28)

$$T = T_s + \frac{P_{\max}'' R^3}{9kR} \left( 1 - \frac{r^3}{R^3} \right)$$

$$T = 381.8 + 6e7 * 0.01^3 / (9 * 3 * 0.01) = 604 \text{ }^\circ\text{C}$$

3. Data:  $T_s = 400 \text{ }^\circ\text{C}$ ;  $P'' = 1e7 \text{ W/m}^3$ ;  $R = 0.01 \text{ m}$

$$k = 0.25 + 0.005 * T = 0.25(1 + 0.02 * T)$$

Therefore,  $\beta = 0.02$ ;

Substituting above in Eq. (40), we get

$$T = \frac{-1 + \sqrt{1 + 2 * 0.02 \left\{ 400 + 0.02 * \frac{400 * 400}{2} + \frac{1e7 * 0.01 * 0.01}{4 * 0.25} (1) \right\}}}{0.02}$$

The maximum temperature is  $500 \text{ }^\circ\text{C}$ .
