

Total Internal Reflection

Light propagation

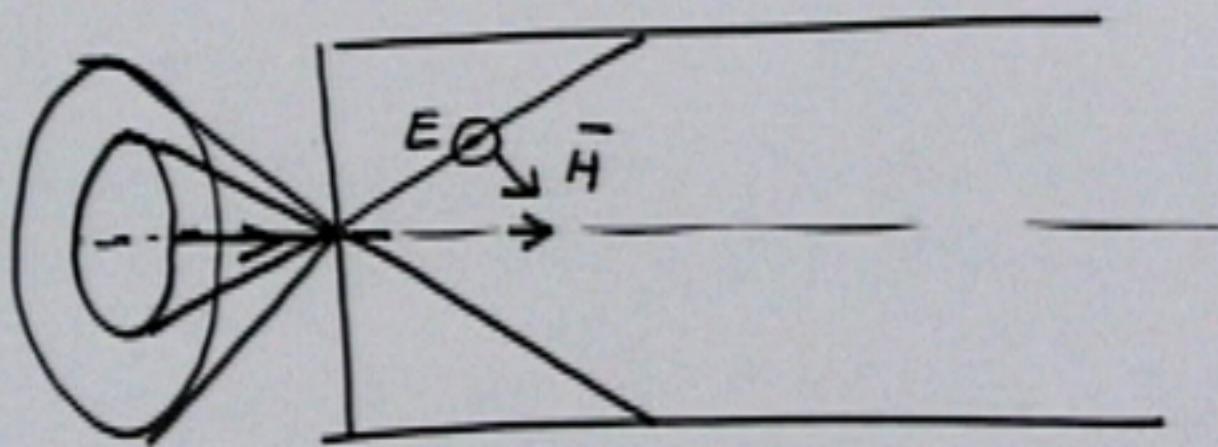

1. Rays can survive at discrete angles
2. There are finite number of rays

$$s_1 = d / \sin \theta$$

$$s_2 = AD \cos \theta = (\cos^2 \theta - \sin^2 \theta) d / \sin \theta$$

$$\frac{2\pi n_1}{\lambda} (s_1 - s_2) + 2\delta = 2\pi m$$

$$\frac{2\pi n_1 d \sin \theta}{\lambda} + \delta = \pi m$$

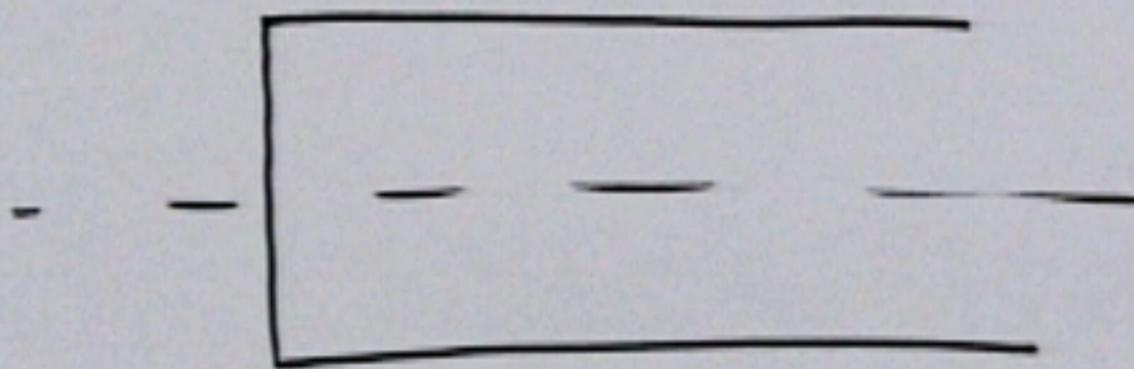

Transverse Electric mode

TE

Transverse Magnetic Mode

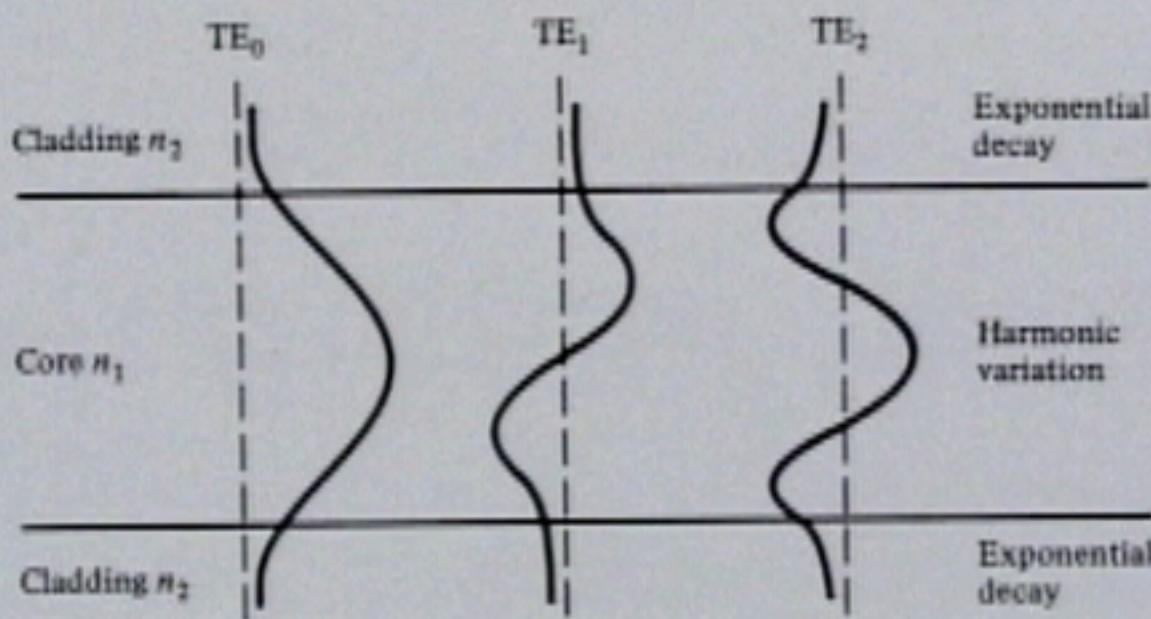

TM

Skew Rays.

Hybrid Modes.

Low-order-mode fields

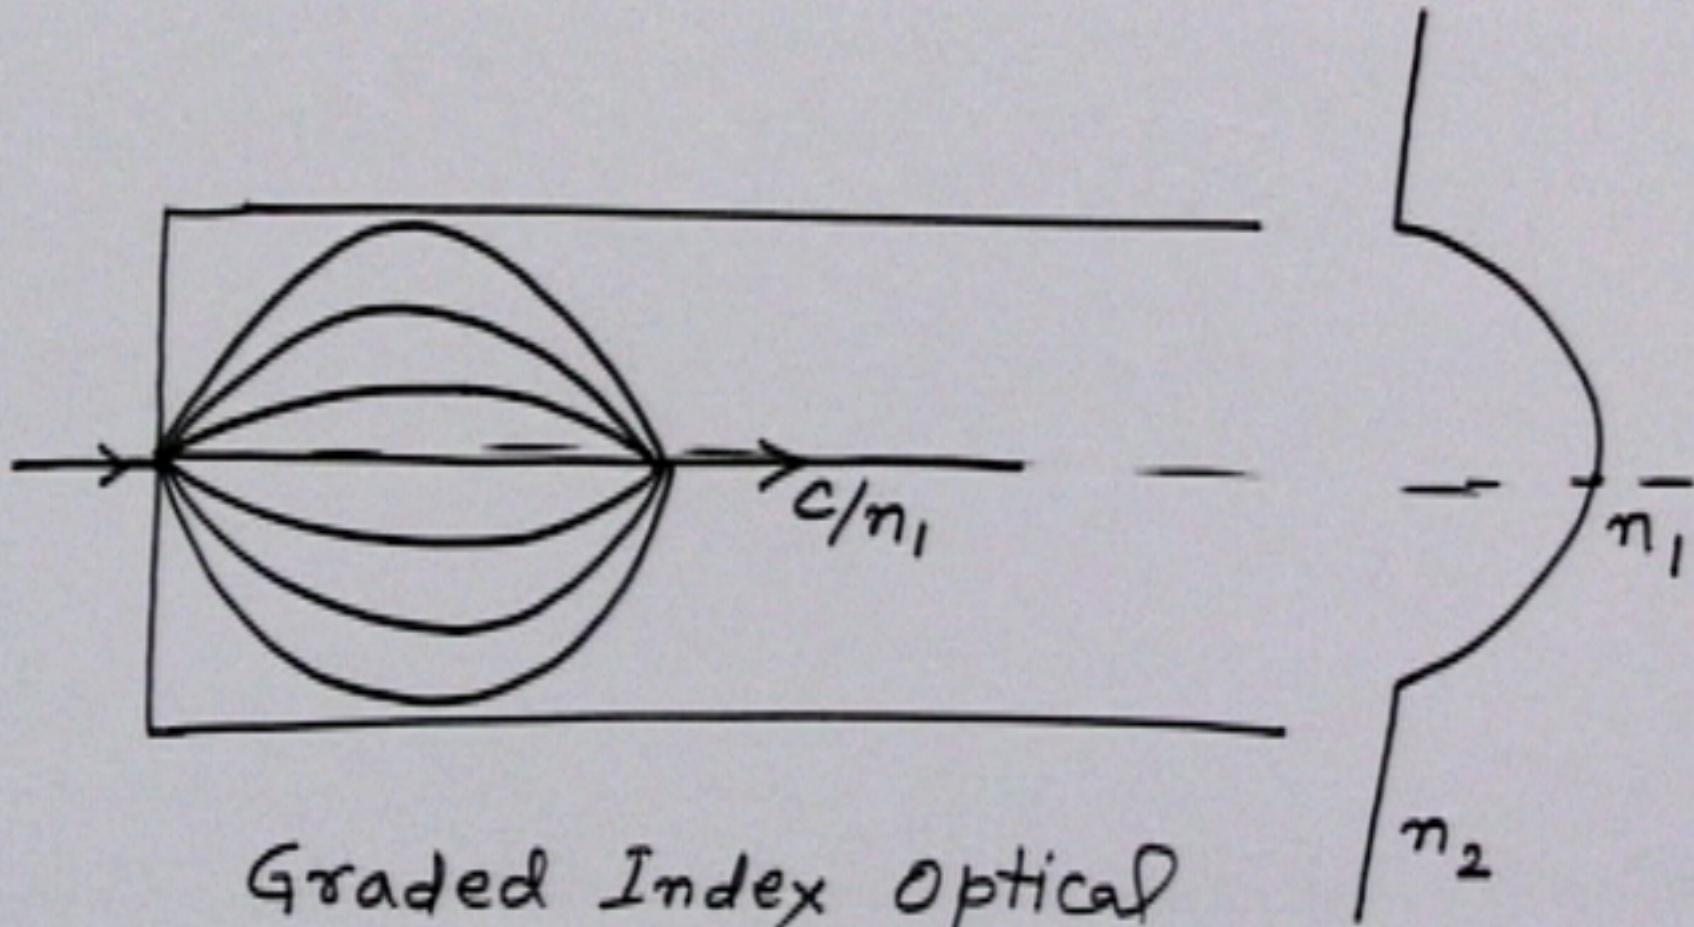

Multimode fiber
(MM)

$d \sim 50-100 \mu\text{m}$

single mode fiber
(SM)

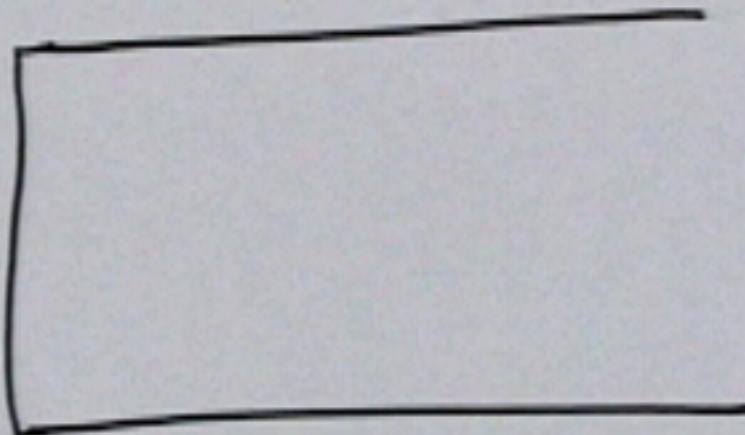

$d \sim 6-8 \mu\text{m}$

cladding diameter = $125 \mu\text{m}$.

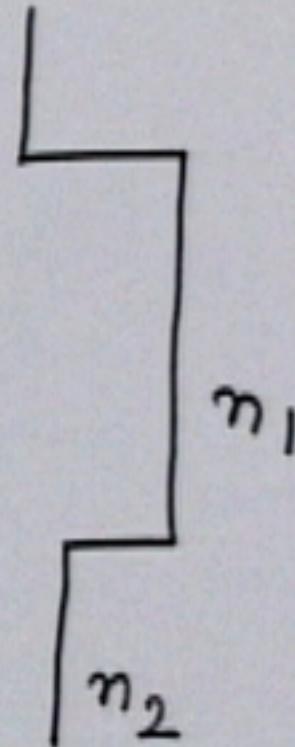

Graded Index Optical

Comparison of fiber structures

$\beta - \omega$ relation.

$$v_p = \text{Phase velocity} = \frac{\omega}{\beta}$$

$$v_g = \text{Group velocity} = \frac{\partial \omega}{\partial \beta}$$
