

Lecture 17

Three stage feed forward compensated opamp:

Phase between -90° & -180°

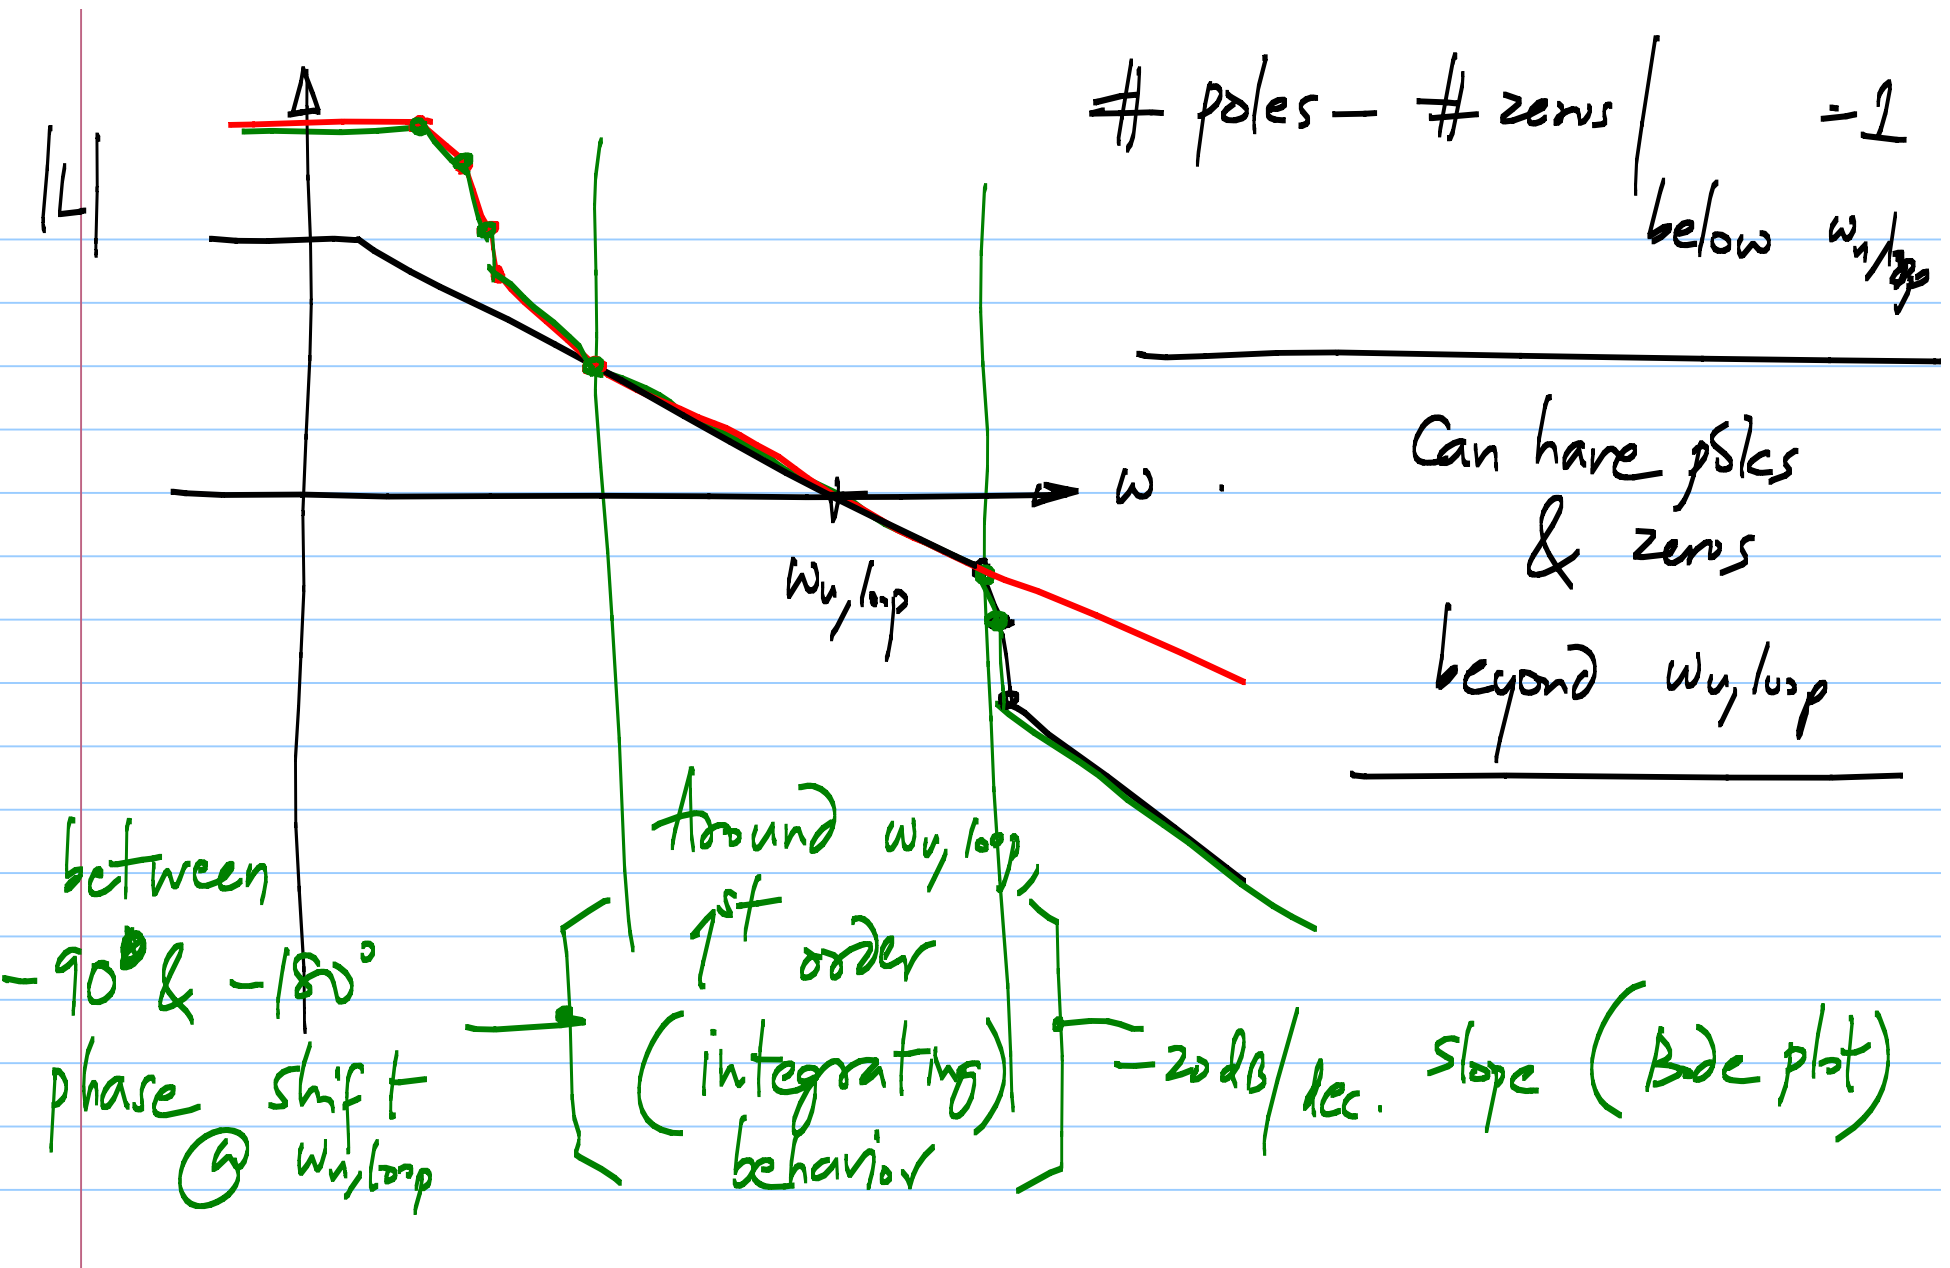

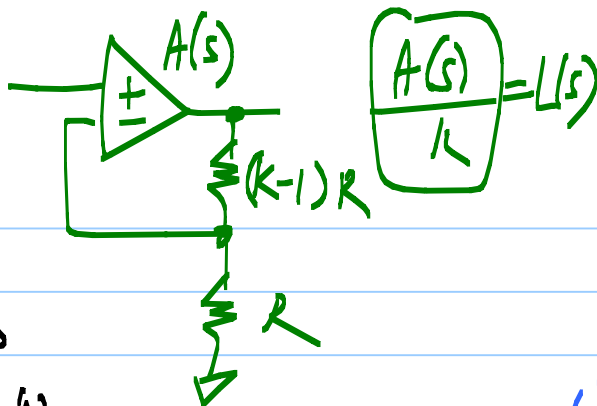

Phase shift = -180° & magnitude > 1
does not mean instability

Phase shift at unity loop gain magnitude ($\omega_{u,loop}$)
must be between -90° & -180° .

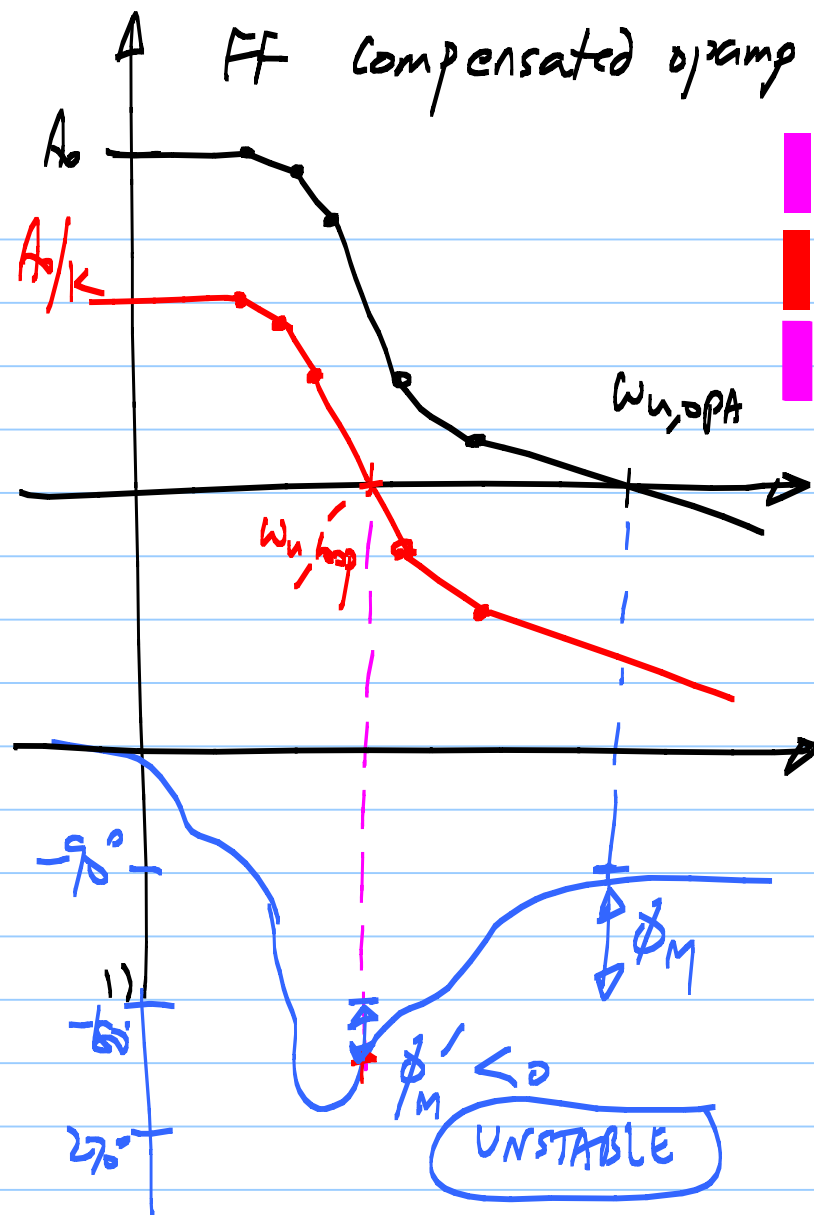

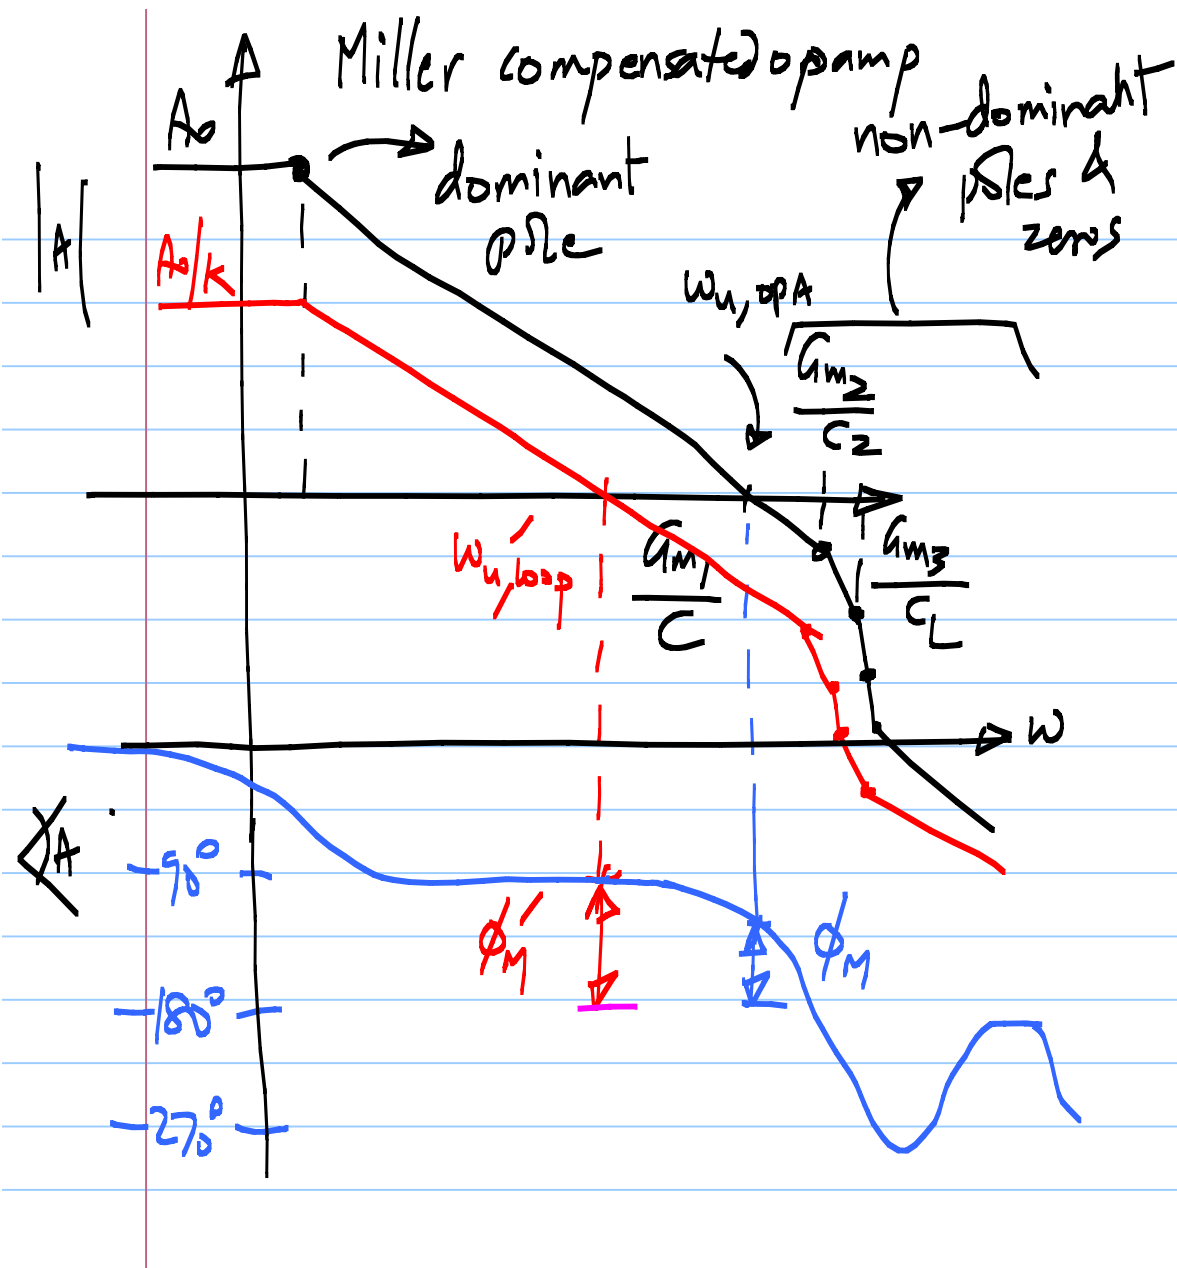

$$\Rightarrow \# \text{poles} - \# \text{zeros} = 1$$

1st order (integrator) behavior around $\omega_{u,loop}$ before $\omega_{u,loop}$

No clockwise encirclement of $(-1, 0) \rightarrow$ stable!

2 stage feed forward compensated opamp

$$\frac{V_o}{V_e} = \frac{g_{m1} + \frac{g_{m2} \cdot g_{m3}}{sC_1}}{sC_L}$$

$$= \frac{g_{m1}}{sC_L} \left(1 + \frac{g_{m2} g_{m3}}{g_{m1} \cdot sC_1} \right) = \frac{\omega_u}{s} \left(1 + \frac{z_1}{s} \right)$$
