Module-3 - The Inverter

Stacking Effect

Assumed:

- 1) $n = 1$
- 2) Body Effect $\gamma = 0$
- 3) DIBL $\eta = 0$
- 4) Large V_{DD} ($V_{DD} > 3\phi_t$)

$$I_{LEAK} = I_0 \frac{W}{2} e^{-\frac{V_t}{\phi_t}}$$
$$V_x = \phi_t \ln 2$$
$$I_{TOT} = I_0 \cdot W e^{-\frac{V_t}{\phi_t}} (1 - e^{-\frac{V_x}{\phi_t}})$$
$$= I_0 \left(\frac{W}{2}\right) e^{-V_t/\phi_t}$$

Remark ($\gamma \neq 0, \eta \neq 0, n = 1.5$) ($V_{DD} > 3\phi_t$)

$$V_{DS} = V_{DD}$$

$$V_{SB} = 0$$

$$V_T = V_{TH0} - \eta V_{DD}$$

N_1	N_2	V_{DS}	V_{SB}	V_{TH}
$(V_{DD} - V_x)$	V_x	V_x	0	$V_{TH0} + \gamma (\sqrt{N_x + \eta_s} - \sqrt{\eta_s}) - \eta (V_{DD} - V_x)$
		(V_{DD})		

$$I_{SMK-2} \ll I_{SMK-1}$$

Compared to NO

V_{TH} of $N_1 \uparrow$ because of (1) DIBL (dominates)

(2) Body effect

SLEEP = 0 (MISSION MODE)

→ VIR GND ~ GND
if SLEEP LARGE

SLEEP = 1 (SLEEP MODE)

RING Oscillator

delay = $N\tau$

$f = 1/2N\tau$
Large 'N'

Process Variations:

GLOBAL PROCESS MONITOR

$N_A \rightarrow 10^{15}/\text{cm}^3$

- 1) LITHO CHARGES
- 2) RANDOM DOPANT FLUCTUATION (RDF) $\rightarrow \sigma_{VT} \propto 1/\sqrt{LW}$
